WWV: All Time, All of the Time

By Barry Mishkind

[September 2019] WWV, the Nations's Timer-keeper, celebrates its 100th Anniversary of receiving its call letters on October 1st 2019.

It is still out there. All you need is a radio capable of receiving 2.5, 5, 10, 15, and 20 MHz. One of these frequencies is available virtually anytime, anywhere in the country.

As you listen, the voice will tell you the time with a tone to synchronize your watch, clock, or automation.

1920

Now run by NIST in Ft. Collins CO, WWV began in Washington D.C., with testing in May of 1920 on 500 m (approximately 600 kHz), after receiving its license and call letters from the Department of Commerce (DOC) on October 1, 1919.

In cooperation with the Department of Agriculture, in 1920 WWV broadcast farm bureau market news. But, with other early stations broadcasting news, it was decided WWV would focus on standardized frequency signals, at first in the 200 to 545 kHz band.

From 1 and 2 kW transmitters, frequencies of 75 kHz to 2 MHz were transmitted with “better than 0.3% accuracy.”

MORE POWER AND ACCURACY

Over the years, the transmitters moved from DC to Maryland, and grew in power.

Quartz oscillators permitted higher accuracy: less than 2 parts in 10^7 deviation. By the mid-1930s, WWV was achieving frequency stability of less than 2 parts in 10^{10} deviation.

AND TIME

As the focus on time continued, the transmitted frequencies “settled” and tones, and then time announcements were added.

In 1936, a 440 Hz (“A above middle C”) was sounded on the hour, and soon more pulses for the seconds. Telegraphic information began in 1945 and on January 1, 1950, voice announcements of the time began every five minutes, in local time.

This changed to Greenwich Mean Time (GMT), now known as Coordinated Universal Time (UTC), in 1967. Four years later, the correct time was now voiced every minute.

A FINAL MOVE

It was December 1, 1966 when the current site – Ft. Collins, Colorado, went online. Some [photos are here](#).

With the new site came new transmitters. Frequency stability was now less than 1 part in 10^{13} deviation. Time accuracy is kept closer than 0.0001 millisecond which, even with signal delay, keeps it within 10 milliseconds at most US reception sites. Scientists and engineers were able to use this to achieve high calibration of all sorts of test equipment.

NIST picture of part of WWV's 5 MHz transmitter

In the past couple of years, the availability of time checks via the Internet have led to rumors that WWV might be shut down to save \$6 million. However, the 2019 Budget did preserve funding for the operations. [WWV's web site is here.](#)

CURRENT SERVICES

WWV does transmit some additional services at various times, including satellite GPS status and some geophysical matters.

In addition to WWV (2.5 to 10 kW), NIST now operates sister station WWVH Kauai, Hawaii. WWV uses a male voice, and WWVH uses a female voice, so listeners can tell which station they are receiving. Announcements are staggered to avoid both being heard at once.

NIST also has WWBV (now 70 kW), running digital time data. And about 2,000 users call for time via telephone, which is available 24/7 at (303) 499-7111 for WWV, and (808) 335-4363 for WWVH.

100 YEARS

To commemorate 100 years, WWV has scheduled a special event. Unfortunately, all the RSVPs were allocated rather quickly. [Some information is here.](#)
